Tyrer-Cusick[®] Breast Cancer Risk Assessment

A new technology

Providence Imaging Center has added the Tyrer-Cuzick (Version 8) risk assessment tool as a complimentary addition to our breast cancer screening and diagnostic services with the goal of providing more personalized medicine.

The Tyrer-Cuzick (Version 8) model incorporates a comprehensive set of variables to assess a woman's lifetime risk of breast cancer. It identifies women at greater than average risk of breast cancer who could benefit from supplemental screening with breast MRI or breast ultrasound. The data collected also identifies families at high risk of hereditary cancer who could benefit from a genetics consultation.

Why measure risk?

- Identify women that may be at high risk
- Educate women about their risk
- Recommend risk based screening

The patient's lifetime risk calculation will be documented on the mammogram report.

Ask your medical provider about the Tyrer-Cuzick model and schedule your breast cancer risk assessment with your screening mammogram at Providence Imaging Center.
